

| | | | | | | | | | |
|---|---|----------------------|-------------|----------------------|-------------|----------------------|-------------|--|-------------------------------|
| <h1 style="text-align: center;">Review Lesson</h1> <h2 style="text-align: center;">Powers of Ten</h2> | <p>1</p> <p>The mass of an electron is 0.0000000000000000000000000000009 kg After doing this painless review you will write it 9×10^{-31} kg, and save yourself mistakes on exams too! <u>Move horizontally.</u> Turn to next page, frame 2</p> | | | | | | | | |
| <p>7</p> <p style="text-align: center;">10^{21}</p> <p>This number, I am told is a sextillion. Our aim is to make such words useless.</p> | <p>8</p> <p>Now multiply:</p> <p style="text-align: center;">$10^5 \times 10^{-2} = 10^{\square}$</p> <p>and</p> <p style="text-align: center;">$10^2 \times 10^{-2} = 10^{\square}$</p> | | | | | | | | |
| <p>14</p> <p style="text-align: center;">1.5×10^{-18}</p> <p>The point took 18 steps to get there.</p> | <p>15</p> <p>It works in the other direction too. The number below is one and a quarter quintillion. Walk the point until it is to the right of the 1, and count off as you go. The power of ten will be the number of steps you took.</p> <p style="text-align: center;">$1250000000000000000. = 1.25 \times 10^{\square}$</p> | | | | | | | | |
| <p>21</p> <p style="text-align: center;">$3 \times 10^{-4} - .2 \times 10^{-4}$</p> <p>which is</p> <p style="text-align: center;">2.8×10^{-4}</p> | <p>22</p> <p>Re-do this column, so it can be added.</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: right;">1.5×10^{-6}</td> <td style="text-align: right;">$x 10^{-6}$</td> </tr> <tr> <td style="text-align: right;">1.8×10^{-4}</td> <td style="text-align: right;">$x 10^{-6}$</td> </tr> <tr> <td style="text-align: right;">1.1×10^{-3}</td> <td style="text-align: right;">$x 10^{-6}$</td> </tr> <tr> <td style="text-align: right;"><u>2.5×10^{-5}</u></td> <td style="text-align: right;"><u>$x 10^{-6}$</u></td> </tr> </table> | 1.5×10^{-6} | $x 10^{-6}$ | 1.8×10^{-4} | $x 10^{-6}$ | 1.1×10^{-3} | $x 10^{-6}$ | <u>2.5×10^{-5}</u> | <u>$x 10^{-6}$</u> |
| 1.5×10^{-6} | $x 10^{-6}$ | | | | | | | | |
| 1.8×10^{-4} | $x 10^{-6}$ | | | | | | | | |
| 1.1×10^{-3} | $x 10^{-6}$ | | | | | | | | |
| <u>2.5×10^{-5}</u> | <u>$x 10^{-6}$</u> | | | | | | | | |
| <p>28</p> <p style="text-align: center;">2×10^{-13}</p> | <p>29</p> <p>Negative exponents are handled in a similar way. Give this one the reducing treatment.</p> $\frac{(4 \times 10^3)(2.2 \times 10^{\square 2})}{4.4 \times 10^{\square 6}}$ | | | | | | | | |
| <p>35</p> <p style="text-align: center;">$10^7 \times \sqrt{25}$</p> <p style="text-align: center;">$= 5 \times 10^7$</p> | <p>36</p> <p>To take cube root we divide the exponent by 3.</p> <p>Example: $\sqrt[3]{10^9} = 10^3$ Can you do $\sqrt[3]{10^{10}}$</p> <p>Hint: First write it as $\sqrt[3]{10^9 \times 10}$</p> | | | | | | | | |
| <p>42</p> <p>(a) 10^{-1}</p> <p>(b) 10^{-12}</p> <p>Quite Different</p> | <p>43</p> <p>If you raise 2×10^4 to the third power, that is, $(2 \times 10^4)^3$ both the 2 and the 4 get raised to the third power.</p> <p>Answer is 8×10^{12}. Do this: $(4 \times 10^2)^{1/2} = ??$</p> | | | | | | | | |

| | |
|--|---|
| <p>1 The correct answer will be in this space. Give yourself a mark in the little square</p> <p>2 if right 0 if wrong 1 if in between</p> <p style="text-align: right;">Here</p> | <p>2 In 10^3, the 3 is the exponent and it says that we have three tens, all multiplied together; that is</p> <p>$10^3 = 10 \times 10 \times 10$</p> <p>Or, $10^3 = 1000$. Finish this: $10^5 = ??$</p> |
| <p>8</p> <p style="text-align: center;">10^3 and 10^0</p> | <p>9 We haven't run into 10^0 before. (Remember where it came from: $10^2 \times 10^{-2}$ which is $100 \times .01$ or just <u>one</u>). 10^0 is 1. We won't do anything more with 10^0 now; just tuck it away in your memory. Next, let's express 5,000,000 as</p> <p style="text-align: center;"><input type="text"/> <math>\times 10^{\text{<input type="text"/></math></p> |
| <p>15</p> <p style="text-align: center;">1.25×10^{18}</p> | <p>16 One more bit of drill. Multiply these:</p> <p>$(10^{-5}) (800 \times 10^8)$ Think of the lowly amoeba: To multiply it must divide!</p> <p style="text-align: center;"><input type="text"/> <math>\times 10^{\text{<input type="text"/></math></p> |
| <p>22</p> $\begin{array}{r} 1.5 \times 10^{-6} \\ 180 \times 10^{-6} \\ 1100 \times 10^{-6} \\ \hline 25 \times 10^{-6} \end{array}$ | <p>23 Add them, and express the answer so that there is only one digit to the left of the decimal point.</p> <p>Could have worked this problem as well by first converting them all to something time 10^{-3}?</p> |
| <p>29</p> <p style="text-align: center;">2×10^7</p> | <p>30 What can you do about this one?</p> <p>$\frac{10^2 + 10^3}{10^2}$ <u>Watch out!</u> You can't cancel that 10^2 against the other 10^2. <u>No!</u> Not when there is another term <u>added</u>.</p> |
| <p>36 It can further be rewritten as</p> <p>$\sqrt[3]{10^9} \times \sqrt[3]{10}$ Then you get</p> <p style="text-align: center;">$10^3 \times \sqrt[3]{10}$</p> | <p>37 So you see there is one 10 we had to leave under a $\sqrt[3]{\quad}$ sign. Of course we can get it out by looking up the $\sqrt[3]{10}$, which is 2.154. so our ans. would be 2.154×10^3. Try $\sqrt[3]{2.7 \times 10^{13}}$. (Keep in mind that 27 is the cube of something.)</p> |
| <p>43</p> <p>2×10 or 20 It is</p> <p style="text-align: center;">$\sqrt{4} \times \sqrt{100}$</p> | <p>44 We have no new tricks to introduce. so let's exercise our talents a little. Exercise and practice is the glue that sticks things in your mind? Step the decimal point and count off.</p> <p style="text-align: center;"><math>16500000000000000. = 1.65 \times 10^{\text{<input type="text"/></math></p> <p style="text-align: center;"><math>350000000. = 3.5 \times 10^{\text{<input type="text"/></math></p> |

| | |
|--|---|
| <p>2</p> <p>10x10x10x10x10 or, 100,000</p> | <p>3 A negative exponent, such as 10^{-3} means the reciprocal of 10^3. Ex: $10^{-3} = \frac{1}{10^3}$ Similarly, $10^3 = \frac{1}{10^{-3}}$ Finish this: $\frac{1}{10^{\square 2}} = 10^{\square}$</p> |
| <p>9</p> <p>5×10^6</p> | <p>10 5,500,000 would be expressed as 5.5×10^6. It could be written as 55×10^5, but <u>by custom</u> we do it so there is only one figure to the left of the decimal point. 5,525,000 would be $\square \times 10^6$</p> |
| <p>16</p> <p>800×10^3 is OK, but a better form would be 8×10^5</p> | <p>17 Our next project is to learn to <u>add</u> and <u>subtract</u> numbers like 2.5×10^5 and 1.2×10^4. The catch is that the two have different powers of ten. We can add or subtract <u>if</u> we first make them have the <u>same</u> power of ten. Next Page -----></p> |
| <p>23</p> <p>$1,3605 \times 10^{-3}$ Yes you could have.</p> | <p>24 Now let's go back to multiplication for a moment. When we want to multiply 1.5×10^3 by 2×10^2 we do it by multiplying the 1.5 x 2 to get 3 and the $10^3 \times 10^2$ to get 10^5, making 3×10^5. Try $3 \times 10^7 \times 4 \times 10^5$</p> |
| <p>30</p> <p>11</p> | <p>31 How did we get it? Either by writing $\frac{10^2 + 10^3}{10^2}$ as $\frac{\cancel{10^2}(1+10)}{\cancel{10^2}}$ or as $\frac{1.1 \times \cancel{10^3}}{\cancel{10^2}}$ and canceling as shown. Now you do $\frac{10^5 + 10^2}{10^2}$</p> |
| <p>37</p> <p>3×10^4</p> | <p>38 Now let me tell you another way of writing square roots and cube roots $\sqrt{100}$ is $100^{1/2}$ and $\sqrt[3]{100}$ is $100^{1/3}$ and $\sqrt[3]{10^3}$ would be $(10^3)^{1/3}$ When a power is raised to a power, we multiply the exponents together. $(10^3)^{1/3}$ is 10^1. What is $(10^6)^{1/2}$?</p> |
| <p>44</p> <p>1.65×10^{15} 3.5×10^7</p> | <p>45 Add these: 5.2×10^{27} 2.0×10^{25} 5.4×10^{26} ----- ???????????</p> |

| | |
|---|---|
| <p>3</p> <p style="text-align: center;">10^2</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>4 Do these</p> $10^{\square 2} = \frac{1}{10^?}$ $10^3 = \frac{1}{10^?}$ |
| <p>10</p> <p style="text-align: center;">5.525×10^6</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>11 Before we go further, a little drill: Complete these:</p> $\frac{1}{10^{\square 5}} = 10^?$ $\frac{1}{5 \times 10^8} = ? \times 10^?$ |
| <p>17 Here is the problem again:</p> <p style="text-align: center;">$2.5 \times 10^5 + 1.2 \times 10^4 = ?$</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>18 If we move the decimal in the second number by one step to the left, we have $2.5 \times 10^5 + .12 \times 10^5$. Now we can add and get 2.62×10^5. Try rewriting the following so that they both will have the same power of 10.</p> <p style="text-align: center;">2×10 and 3.5×10^2</p> |
| <p>24</p> <p style="text-align: center;">12×10^{12}, but we prefer to write</p> <p style="text-align: center;">1.2×10^{13}</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>25 Do these:</p> $(5 \times 10^3) (6 \times 10^{-3}) = ?$ $(3 \times 10^3) (1.2 \times 10^{-10}) = ?$ |
| <p>31</p> <p style="text-align: center;">1001</p> <p style="text-align: center;">or</p> <p style="text-align: center;">1.001×10^3</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>32 We haven't mentioned division, as such, but I guess you know how to do it, from what we have done with fractions. If you want to divide 10^6 by 10^4, all you have to do is write it</p> $\frac{10^6}{10^4} = 10^2, \text{ or you can simply subtract exponents.}$ |
| <p>38</p> <p style="text-align: center;">10^3</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>39 The same goes for integral powers as for fractional powers. Study these example, and note how + and - exponents are treated.</p> $(10^2)^3 = 10^6 \qquad (10^2)^{-3} = 10^{-6} \qquad (10^{-2})^{-2} = 10^4$ $(10^{-2})^{1/2} = 10^{-1} \qquad (10^{-2})^{-1/2} = 10^1 \qquad 10^{\square 1/2} = \frac{1}{\sqrt{10}}$ |
| <p>45</p> <p style="text-align: center;">5.76×10^{27}</p> <div style="border: 1px solid black; width: 50px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>46 What is the cube (not cube root) of 4×10^{-7}?</p> <p>Write the answer with one digit to the left of the decimal point.</p> |

| | |
|---|---|
| <p>4</p> $\frac{1}{10^2}$ $\frac{1}{10^{\square 3}}$ | <p>5</p> <p>0.1 is, of course $\frac{1}{10^1}$ or 10^{-1}</p> <p>Complete this: $.001 = 10^?$</p> |
| <p>11</p> <p>10^5, and</p> <p>$\frac{1}{5} \times 10^{\square 8}$ or 2×10^{-9}</p> | <p>12</p> <p>Put these into exponential form:</p> <p>$.00000000000001 = 10^{??}$</p> <p>$11000000. = ?? \times 10^{??}$</p> |
| <p>18</p> <p>2×10^3 and $.35 \times 10^3$</p> <p>(20×10^2 and 3.5×10^2 would be all right also.)</p> | <p>19 Now see if you can add these two numbers together</p> <p>$1.5 \times 10^4 + 2 \times 10^2 = ??$</p> |
| <p>25</p> <p>30</p> <p>3.6×10^{-7}</p> | <p>26</p> <p>If you have $\frac{5 \times 10^3}{2 \times 10^3}$ you can follow the old rule of canceling like factors in numerator and denominator. What do you have left?</p> |
| <p>32</p> <p>Now we come to the last operation and the hardest one: Roots and fractional powers.</p> | <p>33 The square root of 10^4 is 10^2. You can see this from the reverse operation, namely that 10^2 multiplied by itself is 10^4. You do this one :</p> $\sqrt{10^{12}} = ??$ <p>(The question is, what, when multiplied by itself gives 10^{12}??)</p> |
| <p>39</p> <p>And what about $(10^5)^{1/2}$?</p> <p>This gives $10^{2.5}$ which is $10^2 \times 10^{1/2}$</p> | <p>40 Try these yourself.</p> <p>$(10^{10})^{1/2} = 10^{??}$</p> <p>$(10^9)^{1/2} = 10^{??}$</p> |
| <p>46</p> <p>6.4×10^{20}</p> | <p>47</p> <p>Do some canceling and check this one:</p> $\frac{202 \times 10^{16} \times 2 \times \sqrt{10^{14}}}{4040000} = 10^{??}$ |

| | |
|---|---|
| <p>5</p> <p>10^{-3}</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>6. Notice that in numbers like $10000 = 10^4$ the exponent is the same as the number of zeros. But with negative exponents, e.g., $.0001 = 10^{-4}$ the exponent is one greater than the number of zeros. It would tax our memory less if the two cases were not different. But we can't argue with arithmetic. Complete this one:</p> <p style="text-align: center;">$.0000000001 = 10^{??}$</p> |
| <p>12</p> <p>10^{-13}</p> <p>1.1×10^7</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>13 Put these into exponential form so that there is one figure to the left of the decimal point.</p> <p style="text-align: center;">$0.12 = ??$ $.0033 = ??$</p> |
| <p>19</p> <p>$1.5 \times 10^4 + .02 \times 10^4$</p> <p>which makes 1.52×10^4</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>20 Here is one where a negative exponent is involved. Add these:</p> <p style="text-align: center;">$1.5 \times 10^2 + 4 \times 10^{-1}$</p> |
| <p>26</p> <p>$\frac{5}{2}$ or 2.5</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>27</p> <p>If you have $\frac{5 \times 10^3}{2 \times 10^5}$, remember that 10^5 is $10^2 \times 10^3$, so cancel what you can. What do you have left?</p> |
| <p>33</p> <p>10^6</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>34 Now comes the problem: What if the exponent is not an even number? For instance $\sqrt{10^7}$? We can rewrite it $\sqrt{10^6 \times 10}$ which is $\sqrt{10^6} \times \sqrt{10}$ which is $10^3 \times \sqrt{10}$. How could we handle $\sqrt{3 \times 10^7}$?</p> |
| <p>40</p> <p>10^5 $\frac{10^9}{2}$ or $10^{4.5}$</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>41 Try these</p> <p>$(10^8)^{-1/2} = 10^?$ $(10^9)^{-1/2} = 10^?$</p> <p>$(10^{-2})^{-6} = 10^?$ $(10^{-1/2})^{-6} = 10^?$</p> |
| <p>47</p> <p>10^{19}</p> <div style="border: 1px solid black; width: 40px; height: 20px; margin-left: auto; margin-right: auto;"></div> | <p>48 Cancel and check the answer here, all in one shot, without first removing the square root signs.</p> <p style="text-align: center;">$\frac{10^2 \times \sqrt{10^3} \times \sqrt{10^6}}{\sqrt{10^{11}}} = 10^1$ or just plain 10.</p> |

| | |
|--|--|
| <p>6</p> <p>10⁻¹⁰</p> <p>If you forget whether it is one more or one less than the number of zeros, think of .1 = 10⁻¹, as a check.</p> | <p>7 To <u>multiply</u>, we simply <u>add the exponents</u>. For example, 10² x 10³ = 10⁵. This is reasonable because</p> <p>10² x 10³ = <u>10 x 10 x 10 x 10 x 10</u> which is five tens multiplied together.</p> <p>Multiply this: 10⁶ x 10¹⁵ = 10^{??}</p> |
| <p>13</p> <p>1.2 x 10⁻¹ and 3.3 x 10⁻³</p> | <p>14 Did you notice the exponent you had to use was just the number of places you had to step the decimal point over, to get to right of the first figure which was not zero. Do this one, and count as you walk the point along.</p> <p>.0000000000000000015 = 1.5 x 10^{??}</p> |
| <p>20</p> <p>150.4</p> <p>or</p> <p>1.504 x 10²</p> | <p>21 Here's another: (A subtraction and both have negative exponents besides. Watch out!)</p> <p>3 x 10⁻⁴ - 2 x 10⁻⁵</p> |
| <p>27</p> <p>$\frac{5}{2 \times 10^2}$ which is 2.5 x 10⁻²</p> | <p>28 Shake what you can out of this fellow. That is reduce him to the simplest form.</p> $\frac{4 \times 10^3 \times 2.2 \times 10^2}{4.4 \times 10^{18}}$ |
| <p>34 Rewrite it</p> <p>$\sqrt{30 \times 10^6}$ and the answer is</p> <p>10³ x $\sqrt{30}$</p> | <p>35 You can work this one the same way, only you can end up without any $\sqrt{\quad}$ at all.</p> $\sqrt{2.5 \times 10^{15}}$ |
| <p>41</p> <p>10⁻⁴ 10^{-4.5}</p> <p>10¹² 10³</p> | <p>42 Be sure you distinguish between these two operations:</p> <p>(a) Multiplying 10⁻⁴ by 10³ and (b) raising 10⁻⁴ to the 3rd power.</p> <p>(a) 10⁻⁴ x 10³ = 10[?] (b) (10⁻⁴)³ = 10[?]</p> |
| <p>48 If you checked it give yourself 2. Incidentally, if we could pay you for doing this review would you take</p> <p>\$2^(2³) or \$2^(3²) ??</p> | <p>49 Verify this and you earn your diploma.</p> $\frac{10^5 \times 10^{1/2} \times 9 \times 10^8 \times \frac{10^6}{\sqrt{10^3}} \times 10^{\square 20}}{10^6 \times 10^{\square 19} \times 6 \times 10 \times \sqrt{10000}} = 1.5 \times 10^7$ <p>THE END!!</p> |
