Stoichiometry - Limiting Reactants

1. Hydrogen gas can be produced in the laboratory by the reaction of magnesium metal with hydrochloric acid.
   a) How many grams of hydrogen can be produced when 4.00 g of hydrochloric acid are added to 3.00 g of magnesium?
   b) What is the volume of this hydrogen at standard conditions?

2. Potassium nitrate is widely used as a fertilizer because it provides two essential elements, potassium and nitrogen. It is made by mixing potassium chloride and nitric acid in the presence of oxygen according to the equation:

   $$4KCl + 4HNO_3 + O_2 \rightarrow 4KNO_3 + 2Cl_2 + 2H_2O$$

   How many kilograms of potassium nitrate will be produced from 50.0 kg of potassium chloride and 50.0 kg of nitric acid? An important by-product is chlorine. How many kilograms of chlorine will be produced?

3. Phosphorus forms a compound similar to ammonia. The compound has the formula PH_3 and is called phosphine. It can be prepared by the reaction:

   $$P_4 + 3NaOH + 3H_2O \rightarrow PH_3 + 3NaH_2PO_2$$

   If 20.0 g of phosphorus and 50.0 g of sodium hydroxide are reacted with excess water, how many grams of phosphine will be obtained?

4. Bromine can be prepared by adding chlorine to an aqueous solution of sodium bromide. How many grams of bromine are formed if 25.0 g of sodium bromide and 25.0 g of chlorine are reacted?

5. Silver tarnishes in the presence of hydrogen sulfide, a gas that originate from the decay of food, because of the reaction:

   $$4Ag + 2H_2S + O_2 \rightarrow 2Ag_2S + 2H_2O$$

   The black product, silver sulfide, is the "tarnish". If 25.00 g of silver, 5.00 g of hydrogen sulfide, and 4.00 g of oxygen are present in a reaction mixture, which one is the limiting reactant, and what mass of silver sulfide is produced?

6. Sulfur dioxide can be produced from the reaction of hydrogen sulfide and oxygen as shown by the following reaction: $2H_2S + 3O_2 \rightarrow 2SO_2 + 2H_2O$
   a) How many grams of sulfur dioxide can be produced from 70.0 g of hydrogen sulfide and 125 g of oxygen.
   b) How many grams of excess reactant are left over after the reaction is complete?

7. What mass of carbon disulfide is produced when 17.5 g of carbon are reacted with 39.5 g of sulfur dioxide according to the equation:

   $$5C(s) + 2SO_2(g) \rightarrow CS_2(s) + 4CO(g)$$

8. What mass of P_4 is produced when 41.5 g of $Ca_3(PO_4)_2$, 26.5 g of SiO_2 and 7.80 g of C are reacted according to the equation:

   $$2Ca_3(PO_4)_2 + 6SiO_2 + 10C \rightarrow P_4 + 6CaSiO_3 + 10CO$$

9. What volume of carbon dioxide, measured at STP, can be produced when 15.65 g of pentane is reacted with 40.0 L of oxygen, measured at STP, according to the equation:

   $$C_5H_{12}(l) + 8O_2(g) \rightarrow 5CO_2(g) + 6H_2O(l)$$

10. What mass of hydrogen chloride gas is produced when 4.50 g of hydrogen and 140.0 g of chlorine are reacted. Which reactant is in excess and how much remains unreacted?

11. The roasting of siderite ore, $FeCO_3$, produces ferric oxide:

    $$4FeCO_3(s) + O_2(g) \rightarrow 2Fe_2O_3(s) + 4CO_2(g)$$

    What mass of ferric oxide is produced when 55.0 g of siderite is reacted with 40.0 L of oxygen gas? Which reactant is in excess and how much remains unreacted?

12. A manufacturer of bicycles has 5050 wheels, 3013 frames, and 2455 handlebars.
    a) How many bicycles can be manufactured using these parts?
    b) How many parts of each kind are left over?
    c) Which part is like a limiting reactant in that it limits the production of bicycles?

13. The fizz produced when an Alka-Seltzer tablet is dissolved in water is due to the reaction between sodium bicarbonate and citric acid:

    $$3NaHCO_3(aq) + H_3C_6H_5O_7(aq) \rightarrow 3CO_2(g) + 3H_2O(l) + Na_3C_6H_5O_7(aq)$$

    In a certain experiment 1.00 g of sodium bicarbonate and 1.00 g of citric acid are allowed to react.
    a) What volume of carbon dioxide is formed?
    b) Which reactant is the limiting reactant?
    c) How much of the excess reactant remains after the limiting reactant is completely consumed?

14. One of the steps in the commercial process for converting ammonia to nitric acid involves the conversion of ammonia to nitrogen monoxide:

    $$2NH_3(g) + 5O_2(g) \rightarrow 4NO(g) + 6H_2O(g)$$

    In a certain experiment 2.50 g of ammonia reacts with 2.85 g of oxygen.
    a) What mass of nitrogen monoxide is formed?
    b) Which reactant is the limiting reactant?
    c) How much of the excess reactant remains after the limiting reactant is completely consumed?
