## Acids and Bases - Notes

## Anhydrous

- without water

## Basic Anhydride

- Substance that produces a base in water
- Generally a metallic oxide
o $\mathrm{Na}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{NaOH}$
o $\mathrm{CaO}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Ca}(\mathrm{OH})_{2}$

## Acidic Anhydride

- Substance that produces an acid in water
- Generally a non-metallic oxide
$\left.\begin{array}{ll}0 & \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2} \mathrm{CO}_{3} \\ 0 & \mathrm{SO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2} \mathrm{SO}_{3} \\ 0 & \mathrm{SO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2} \mathrm{SO}_{4} \\ 0 & \mathrm{~N}_{2} \mathrm{O}_{5}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HNO}_{3} \\ 0 & \mathrm{NO}_{x}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HNO}_{3}+\mathrm{HNO}_{2}\end{array}\right\} \quad$ Source of Acid Rain

## Neutralization Reactions

- Acid + Base $\rightarrow$ Salt + Water
$\begin{array}{ll}\text { o } & \mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O} \\ \text { o } & \mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{KOH} \rightarrow \mathrm{K}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}\end{array}$

## Hydrolysis Reaction

- The reaction of a salt with water to produce an acidic or basic solution.
- Salt + Water $\rightarrow$ Acid + Base
- $\mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow \underset{\downarrow}{\mathrm{HCl}}+\underset{\downarrow}{\mathrm{NaOH}} \xrightarrow{\downarrow} \quad \begin{aligned} & \text { (strong acid + strong base) }\end{aligned}$
$\mathrm{H}^{+}+\mathrm{Cl}^{-} \mathrm{Na}^{+}+\mathrm{OH}^{-}$
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{-}\right], \quad \therefore$ the solution is neutral and hydrolysis does not occur.
- $\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{NaOH}$

$$
\downarrow \uparrow \quad \downarrow \quad \text { (weak acid + strong base) }
$$

$\mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-} \quad \mathrm{Na}^{+}+\mathrm{OH}^{-}$
$\left[\mathrm{H}^{+}\right]<\left[\mathrm{OH}^{-}\right], \quad \therefore$ the solution is basic and hydrolysis does occur.

- $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \underset{\downarrow}{2 \mathrm{HNO}_{3}}+\quad \mathrm{Zn}(\mathrm{OH})_{2}$
$2 \mathrm{H}^{+}+2 \mathrm{NO}_{3}^{-} \quad \mathrm{Zn}^{2+}+2 \mathrm{OH}^{-}$
$\left[\mathrm{H}^{+}\right]>\left[\mathrm{OH}^{-}\right], \quad \therefore$ the solution is acidic and hydrolysis does occur.

Naming Acids: The formula of an acid is one or more hydrogens bonded to a monatomic or polyatomic anion. The way that the acid is named is determined by the suffix of the anion.

| hydroge | ide | becomes hy | ic acid |  |
| :---: | :---: | :---: | :---: | :---: |
| hydrogen | ate | becomes |  |  |
| hydrogen |  | becomes |  |  |
| examples: | HCl | hydrogen chloride | becomes | hydrochloric acid |
|  | $\mathrm{HClO}_{4}$ | hydrogen perchlorate | becomes | perchloric acid |
|  | $\mathrm{HClO}_{3}$ | hydrogen chlorate | becomes | chloric acid |
|  | $\mathrm{HClO}_{2}$ | hydrogen chlorite | becomes | chlorous acid |
|  | HClO | hydrogen hypochlorite | becomes | hypochlorous acid |
