## Equilibrium \& Reaction Rate

1. One of the important reactions in coal gasification is the catalytic methanation reaction:

$$
\mathrm{CO}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \leftrightarrows \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{CH}_{4}(\mathrm{~g}) \quad \Delta \mathrm{H}^{\circ}=-206 \mathrm{~kJ}
$$

a) Predict the direction in which this equilibrium shifts in response to an increase in temperature, and give the reason.
(Value: 2)
The reaction is exothermic and produces heat as it proceeds to the right. Therefore, an increase in temperature will shift the equilibrium to the left to use heat and reduce the effect of the temperature increase.
b) Predict the direction in which this equilibrium shifts in response to an increase in pressure caused by a decrease in reaction volume, and give the reason.
(Value: 2)
The reaction has four gaseous molecules on the left and only two gaseous molecules on the right. Therefore, an increase in pressure will shift the equilibrium to the right (the side with fewer gaseous molecules) which reduces the effect of the pressure increase.
2. This is the potential energy diagram of a given reaction:

a) What is the activation energy of the forward reaction?
(Value: 1)
80 kJ
b) What is the $\Delta \mathrm{H}$ of the forward reaction?
$-40 \mathrm{~kJ}$
c) Sketch, on the diagram, a possible energy curve if the same reaction were to be catalyzed.
(Value: 1)

L. h. s. - Equilibrium \& Reaction Rate - Page 1 of 10
d) Explain, with reference to the diagram, how a catalyst affects the rates of both the forward and reverse reactions.

A catalyst provides an alternative pathway that has lower activation energies for both the forward and the reverse reactions. Thus, the rates of both the forward and the reverse reactions increase as more collisions exceed the lower activation energies of the catalyzed pathway.
3. The activation energy for the process below is 155 kJ .

$$
\mathrm{H}_{2}+\mathrm{Cl}_{2} \leftrightarrows 2 \mathrm{HCl}+184 \mathrm{~kJ}
$$

a) Draw a potential energy diagram for this reaction. Label the axes. Label the parts of the diagram that represent the reactants, the products, the activated complex, the activation energy for the forward reaction, and the $\Delta H$.
(Value: 3)

b) What is the activation energy for the decomposition of HCl to give $\mathrm{H}_{2}$ and $\mathrm{Cl}_{2}$ ?
(Value: 1)
$155 \mathrm{~kJ}+184 \mathrm{~kJ}=339 \mathrm{~kJ}$
4. Consider the equation:

$$
\mathrm{Br}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{Br}(\mathrm{~g}) \quad \mathrm{K}=1.04 \times 10^{-3} \text { at a constant temperature }
$$

If a 0.200 L vessel contains $4.34 \times 10^{-2}$ mol of $\mathrm{Br}_{2}$ at equilibrium, what concentration of Br is present?
(Value: 4)

$$
\begin{aligned}
& {\left[\mathrm{Br}_{2}\right]=\frac{4.34 \times 10^{-2} \mathrm{~mol}}{0.200 \mathrm{~L}}=2.17 \times 10^{-1} \mathrm{~mol} / \mathrm{L}} \\
& \mathrm{~K}=\frac{[\mathrm{Br}]^{2}}{\left[\mathrm{Br}_{2}\right]}=1.04 \times 10^{-3} \\
& {[\mathrm{Br}]=\sqrt{\left(1.04 \times 10^{-3}\right)\left(2.17 \times 10^{-1} \mathrm{~mol} / \mathrm{L}\right)}=1.50 \times 10^{-2} \mathrm{~mol} / \mathrm{L}}
\end{aligned}
$$

5. Consider the following reaction:

$$
3 X(g)+Y(g) \leftrightarrows 2 W(g)+Z(g)
$$

At 298 K the equilibrium concentrations of $X, Y, W$, and $Z$ were found to be $7.0 \mathrm{~mol} / \mathrm{L}, 6.0 \mathrm{~mol} / \mathrm{L}, 5.0 \mathrm{~mol} / \mathrm{L}$, and 7.0 $\mathrm{mol} / \mathrm{L}$, respectively. When the temperature was raised to 313 K the new equilibrium concentration of $Z$ was found to be $6.0 \mathrm{~mol} / \mathrm{L}$.
a) What are the new equilibrium concentrations of the other three substances?
(Value: 3)
$3 X(g)+Y(g) \leftrightarrows 2 W(g)+Z(g)$

| [initial equilibrium] | 7.0 | 6.0 | 5.0 | 7.0 |
| :--- | ---: | ---: | ---: | ---: |
| [change] | +3.0 | +1.0 | -2.0 | -1.0 |
| [new equilibrium] | 10.0 | 7.0 | 3.0 | 6.0 |

## The new equilibrium concentrations are:

$$
[X]=10.0 \mathrm{~mol} / \mathrm{L},[Y]=7.0 \mathrm{~mol} / \mathrm{L}, \text { and }[W]=6.0 \mathrm{~mol} / \mathrm{L}
$$

b) What is the new $K_{\text {eq }}$ ?
(Value: 1)

$$
K_{\text {eq }}=\frac{[W]^{2}[Z]}{[X]^{3}[y]}=\frac{(3.0)^{2}(6.0)}{(10.0)^{3}(7.0)}=0.0077
$$

6. Draw a potential energy diagram for a reaction in which the heat of reaction is $\Delta H=-80 \mathrm{~kJ} / \mathrm{mol}$; and the activation energy is $28 \mathrm{~kJ} / \mathrm{mol}$. Label both axes, the activation energy, heat of reaction, site of activated complex, reactants and products. Show on the diagram, using a dashed line, how a catalyst is effective in increasing the reaction rate.
(Value: 3)

7. The activation energy for the decomposition of hydrogen peroxide, $\mathrm{H}_{2} \mathrm{O}_{2}$, is estimated to be $75 \mathrm{~kJ} / \mathrm{mol}$, while the activation energy for the reaction catalyzed by $\mathrm{I}^{-}$is $48 \mathrm{~kJ} / \mathrm{mol}$. The mechanism of the catalyzed reaction is thought to be:

$$
\begin{gathered}
\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq})+\mathrm{I}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{IO}^{-}(\mathrm{aq}) \\
\mathrm{IO}^{-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{O}_{2}(\mathrm{~g})+\mathrm{I}^{-}(\mathrm{aq})
\end{gathered} \text { (slow)} \text { (fast) }
$$

a) What is a reactive intermediate in this mechanism?
(Value: 1)
IO
b) Explain why $\mathrm{I}^{-}(\mathrm{aq})$ is a catalyst.
(Value: 1)

## It is present as a reactant yet it is also present as a product in the second reaction.

c) Write the balanced equation for the overall reaction.
(Value: 1)

$$
2 \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}_{2}
$$

d) Sketch an unlabelled energy profile curve for the uncatalyzed exothermic reaction.
(Value: 1)

8. Explain the effect a catalyst has on a system that is already at equilibrium.
(Value: 2)

## A catalyst, since it affects both the forward and reverse rates equally, has no effect on a system that is already at equilibrium.

9. The Deacon process is used to make chlorine gas from hydrogen chloride, especially in situations where a large amount of by-product HCl is available from other chemical processes.

$$
4 \mathrm{HCl}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+2 \mathrm{Cl}_{2}(\mathrm{~g}) \quad \Delta \mathrm{H}=-114 \mathrm{~kJ}
$$

A mixture of $\mathrm{HCl}, \mathrm{O}_{2}, \mathrm{H}_{2} \mathrm{O}$, and $\mathrm{Cl}_{2}$ is brought to equilibrium in a 2.00 L closed flask at $400^{\circ} \mathrm{C}$. What will be the effect on the equilibrium amount of $\mathrm{Cl}_{2}(g)$ if:
a) additional $\mathrm{O}_{2}(\mathrm{~g})$ is added to the mixture at constant volume?
(Value: 1)
increase $\mathrm{Cl}_{2}$
b) $\mathrm{HCl}(\mathrm{g})$ is removed from the reaction mixture at constant volume.
(Value: 1)
decrease $\mathrm{Cl}_{2}$
c) the mixture is transferred to a vessel of twice the volume as the original equilibrium volume?
(Value: 1)
decrease $\mathrm{Cl}_{2}$
d) the temperature is raised to $500^{\circ} \mathrm{C}$ ?
(Value: 1)
decrease $\mathrm{Cl}_{2}$
e) When 2.50 mol of $\mathrm{HCl}(\mathrm{g})$, and 1.60 mol of $\mathrm{O}_{2}(\mathrm{~g})$ are mixed in the flask and allowed to come to equilibrium, 0.60 mol of $\mathrm{Cl}_{2}(\mathrm{~g})$ were obtained. Calculate the equilibrium constant, Keq, for this reaction.

|  | $4 \mathrm{HCl}(\mathrm{g})$ | $+\mathrm{O}_{2}(\mathrm{~g})$ | $\leftrightarrows$ | $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | + |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | $2 \mathrm{Cl}_{2}(\mathrm{~g})$ |  |  |  |  |
| [Initial] | 1.25 | 0.800 | 0.00 | 0.00 |  |
| [Change] | -0.60 | -0.15 | +0.30 | +0.30 |  |
| [Equilibrium] | 0.65 | 0.65 | 0.30 | 0.30 |  |

$\mathrm{K}_{\text {eq }}=\frac{\left[\mathrm{H}_{2} \mathrm{O}\right]^{2}\left[\mathrm{Cl}_{2}\right]^{2}}{[\mathrm{HCl}]^{4}\left[\mathrm{O}_{2}\right]}=\frac{(0.30)^{2}(0.30)^{2}}{(0.65)^{4}(0.65)}=0.070$
f) At these conditions, are the reactants or products favoured? Explain briefly.
(Value: 1)
Since the Keq < 1, the reactants are favoured. There were more reactants than products.
10. Ammonia is manufactured by the reaction between nitrogen and hydrogen, using the Haber process:

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

a) State and explain the effect of increasing the concentrations of the reactants on the yield of ammonia obtained.
(Value: 2)
Increasing the concentrations of the reactants increases the yield of ammonia obtained. This action creates a stress on the equilibrium in the form of increased reactant concentrations. The equilibrium shifts to the right in order to reduce the stress by consuming reactant molecules, and more ammonia is produced.
b) State and explain the effect of using a catalyst on the yield of ammonia obtained.
(Value: 2)
Using a catalyst has no effect on the yield of ammonia obtained. The catalyst increases both the forward rate and the reverse rate in a way that does not change the yield of ammonia.
11. When 0.100 mol of $\mathrm{N}_{2}(\mathrm{~g})$ and 0.300 mol of $\mathrm{H}_{2}(\mathrm{~g})$ are placed in a 1.00 L container, some $\mathrm{NH}_{3}(\mathrm{~g})$ forms before equilibrium is reached.

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

Only 0.022 mol of $\mathrm{N}_{2}(\mathrm{~g})$ reacted, and 0.078 mol remains unreacted.
a) What is the equilibrium concentration of each substance?
(Value: 2)

|  | $\mathrm{N}_{2}(\mathrm{~g})$ | + | $3 \mathrm{H}_{2}(\mathrm{~g})$ | $\leftrightarrows$ | $2 \mathrm{NH}_{3}(\mathrm{~g})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Initial | $0.100 \mathrm{~mol} / \mathrm{L}$ |  | $0.300 \mathrm{~mol} / \mathrm{L}$ |  | $0.000 \mathrm{~mol} / \mathrm{L}$ |
| Change | -0.022 mol/ |  | -0.066 mol $/ \mathrm{L}$ |  | +0.044 mol/ |
| Equilibrium | $0.078 \mathrm{~mol} / \mathrm{L}$ |  | $0.234 \mathrm{~mol} / \mathrm{L}$ |  | $0.044 \mathrm{~mol} / \mathrm{L}$ |

$$
\left[\mathrm{N}_{2}\right]=0.078 \mathrm{~mol} / \mathrm{L} \quad\left[\mathrm{H}_{2}\right]=0.234 \mathrm{~mol} / \mathrm{L} \quad\left[\mathrm{NH}_{3}\right]=0.044 \mathrm{~mol} / \mathrm{L}
$$

b) Calculate the numerical value for the equilibrium constant for this system.

$$
K=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}=\frac{(0.044)^{2}}{(0.078)(0.234)^{3}}=19
$$

12. Consider the five reactions whose activation energies $\left(E_{a}\right)$ and $\Delta H$ values are listed in the table.

| Reaction | $E_{a}(\mathrm{~kJ} / \mathrm{mol})$ | $\Delta H(\mathrm{~kJ} / \mathrm{mol})$ |
| :---: | :---: | :---: |
| $A$ | 60 | 20 |
| $B$ | 6 | 3 |
| $C$ | 50 | 30 |
| $D$ | 5 | -1000 |
| $E$ | 100 | -30 |

a) Which one of the reactions represents:
i) the slowest reaction.
(Value: 1)

## $E$

ii) an explosive exothermic reaction.
(Value: 1)
D
iii) a spontaneous endothermic reaction.
(Value: 1)
B
b) If a catalyst were added to reaction $A$, what would be the effect on the values of $E_{a}$ and $\Delta H$ given in the table for that reaction?
(Value: 1)
The numerical value of $E_{a}$ would decrease, but the numerical value of $\Delta H$ would remain the same.
13. At $1495^{\circ} \mathrm{C}$ the equilibrium, $\quad \mathrm{H}_{2}(g)+\mathrm{Br}_{2}(g) \leftrightarrows 2 \mathrm{HBr}(g)$, has an equilibrium constant that equals $3.5 \times 10^{4}$. If the equilibrium concentrations of $\mathrm{H}_{2}$ and $\mathrm{Br}_{2}$ are $0.010 \mathrm{~mol} / \mathrm{L}$ and $0.020 \mathrm{~mol} / \mathrm{L}$ respectively, what is the equilibrium concentration of HBr ?
(Value: 2)

$$
\begin{aligned}
& K=\frac{[\mathrm{HBr}]^{2}}{\left[\mathrm{H}_{2}\right]\left[\mathrm{Br}_{2}\right]}=3.5 \times 10^{4} \\
& \frac{[\mathrm{HBr}]^{2}}{(0.0100)(0.020)}=3.5 \times 10^{4}
\end{aligned}
$$

$[\mathrm{HBr}]=\sqrt{(3.5 \times 104)(0.010)(0.020)}=2.6 \mathrm{~mol} / \mathrm{L}$
14. At $21.8^{\circ} \mathrm{C}$ the equilibrium, $\quad \mathrm{NH}_{4} \mathrm{HS}(\mathrm{s}) \leftrightarrows \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$, has an equilibrium constant that equals $1.2 \times 10^{-4}$. A sample of solid $\mathrm{NH}_{4} \mathrm{HS}$ is placed in a closed container and allowed to decompose until equilibrium is reached at $21.8^{\circ} \mathrm{C}$. Calculate the equilibrium concentrations of $\mathrm{NH}_{3}$ and $\mathrm{H}_{2} \mathrm{~S}$.
(Value: 2)

$$
K=\left[\mathrm{NH}_{3}\right]\left[\mathrm{H}_{2} \mathrm{~S}\right]=1.2 \times 10^{-4}
$$

## * $\mathrm{NH}_{4} \mathrm{HS}(\mathrm{s})$ is not included in the equilibrium expression because it is a solid

## At equilibrium :

$\left[\mathrm{NH}_{3}\right]=\left[\mathrm{H}_{2} \mathrm{~S}\right]=\sqrt{1.2 \times 10^{-4}}=1.1 \times 10^{-2} \mathrm{~mol} / \mathrm{L}$
15. Consider the reaction:

$$
\begin{aligned}
& \mathrm{I}_{2}(\mathrm{aq})+\underset{\substack{ \\
\text { yellow } \\
\text { colourless }} \underset{\mathrm{S}_{2} \mathrm{O}_{3}^{2-}(\mathrm{aq})}{\mathrm{S}_{4} \mathrm{O}_{6}{ }^{2-}(\mathrm{aq})}+2 \mathrm{I}^{-}(\mathrm{aq})}{\text { colourless colourless }}
\end{aligned}
$$

a) Suggest a method for measuring the rate of this reaction.
(Value: 1)
The rat of this reaction could be measured by determining the amount of time required for the yellow colour to disappear.
b) Define the rate of this reaction qualitatively.
(Value: 1)
The rate of this reaction can be defined as the change in concentration (mol/L) or quantity (mol) of $I_{2}$ per unit time.
16. Distinguish an activated complex from a catalyst by stating:
a) how they are different.
(Value: 2)
A catalyst is present at both the beginning and the end of a reaction. An activated complex is formed during the reaction and is consumed as the reaction takes place.
OR:
A catalyst is added to the reaction vessel while an activated complex forms during the reaction.
b) how they are alike.
(Value: 2)
Neither a catalyst nor an activated complex appears in the balanced chemical equation for the reaction, but they are both part of the reaction mechanism.
17. The air we breathe is composed of $\mathrm{N}_{2}(\mathrm{~g})$ and $\mathrm{O}_{2}(\mathrm{~g})$. A reaction between these two elements to form $\mathrm{NO}(\mathrm{g})$ occurs under the appropriate conditions. At $37^{\circ} \mathrm{C}$, the equilibrium constant for this reaction is $1 \times 10^{-12}$.

$$
\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{NO}(\mathrm{~g})
$$

a) Write the equilibrium constant expression for this reaction.
(Value: 1)

$$
\mathrm{K}=\frac{[\mathrm{NO}]^{2}}{\left[\mathrm{~N}_{2}\left[\mathrm{O}_{2}\right]\right.}
$$

b) Which will have the higher concentration: $\mathrm{N}_{2}(\mathrm{~g})$ and $\mathrm{O}_{2}(\mathrm{~g})$ or $\mathrm{NO}(\mathrm{g})$ at equilibrium at $37^{\circ} \mathrm{C}$ ? Justify your answer.

There will be relatively high concentrations of the reactants, $\mathrm{N}_{2}(g)$ and $\mathrm{O}_{2}(g)$ at equilibrium. Since the numerical value of the equilibrium constant is small, the concentrations of the substances which appear in the denominator of the equilibrium constant expression (the reactants) must be large.
c) What will happen to the amount of $\mathrm{N}_{2}(\mathrm{~g})$ if the concentration of $\mathrm{O}_{2}(\mathrm{~g})$ is decreased?
(Value: 1)
The amount of $\mathrm{N}_{2}(g)$ will increase if the concentration of $\mathrm{O}_{2}(g)$ is decreased.
18. Consider the equilibrium:

$$
\mathrm{Br}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{Br}(\mathrm{~g}) \quad \mathrm{K}=1.26 \times 10^{-3} \text { at a constant temperature }
$$

If a 0.200 L vessel contains $3.44 \times 10^{-2}$ mol of $\mathrm{Br}_{2}$ at equilibrium, what concentration of Br is present?
(Value: 4)

$$
\begin{aligned}
& {\left[\mathrm{Br}_{2}\right]=\frac{3.44 \times 10^{-2} \mathrm{~mol}}{0.200 \mathrm{~L}}=1.72 \times 10^{-1} \mathrm{~mol} / \mathrm{L}} \\
& \mathrm{Br}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{Br}(\mathrm{~g}) \\
& \mathrm{K}=\frac{[\mathrm{Br}]^{2}}{\left[\mathrm{Br}_{2}\right]}=1.26 \times 10^{-3} \\
& {[\mathrm{Br}]=\sqrt{\left(1.26 \times 10^{-3}\right)\left[\mathrm{Br}_{2}\right]}=\sqrt{\left(1.26 \times 10^{-3}\right)\left(1.72 \times 10^{-1}\right)}} \\
& {[\mathrm{Br}]=1.47 \times 10^{-2} \mathrm{~mol} / \mathrm{L}}
\end{aligned}
$$

19. An equilibrium mixture of $\mathrm{SO}_{2}, \mathrm{O}_{2}$, and $\mathrm{SO}_{3}$ contains equal concentrations ( $1.0 \mathrm{~mol} / \mathrm{L}$ ) of $\mathrm{SO}_{2}$ and $\mathrm{SO}_{3}$ :

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{SO}_{3}(\mathrm{~g}) \quad \mathrm{K}=2.7 \times 10^{2}
$$

Calculate the equilibrium concentration of $\mathrm{O}_{2}$.
(Value: 2)
$\mathrm{K}=\frac{\left[\mathrm{SO}_{3}\right]^{2}}{\left[\mathrm{SO}_{2}\right]^{2}\left[\mathrm{O}_{2}\right]}=2.7 \times 10^{2}$
$\left[O_{2}\right]=\frac{(1.0)^{2}}{(1.0)^{2}\left(2.7 \times 10^{2}\right)}=\frac{1}{2.7 \times 10^{2}}=3.7 \times 10^{-3} \mathrm{~mol} / \mathrm{L}$
20. Chlorine and iodine react to form $\mathrm{ICl}: \quad \quad \mathrm{I}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \leftrightarrows 2 \mathrm{ICl}(\mathrm{g}) \quad \mathrm{K}=9.1$

A 1.00 L reaction vessel contains a mixture of 0.0091 mol ICl and 0.0050 mol each of $\mathrm{I}_{2}$ and $\mathrm{Cl}_{2}$. Is the reaction at equilibrium or does it move in the forward or reverse direction? Show the calculations that enable you to answer this question.
(Value: 4)
$\mathrm{K}=\frac{[\mathrm{ICl}]^{2}}{\left[\mathrm{I}_{2} \| \mathrm{Cl}_{2}\right]}=9.1$
$Q=\frac{[I C 1]^{2}}{\left[I_{2} \| C_{2}\right]}=\frac{(0.0091) 2}{(0.0050)(0.0050)}=3.3$
$Q \neq K, \quad \therefore$ The reaction is not at equilibrium
The reaction moves in the forward direction so that the numerator (products) in the equilibrium constant expression will increase and the denominator (reactants) will decrease, giving a larger numerical value (9.1).
21. Sketch a potential energy diagram for the reaction of nitrogen dioxide with oxygen:

$$
\mathrm{NO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows \mathrm{NO}(\mathrm{~g})+\mathrm{O}_{3}(\mathrm{~g}) \quad \Delta \mathrm{H}=+199 \mathrm{~kJ}
$$

The value of the activation energy (Ea) for the forward reaction is $209 \mathrm{~kJ} / \mathrm{mol}$. Your sketch should show the values of the forward and reverse activation energies and $\Delta H$.
(Value: 4)

22. An experiment starting with no $\mathrm{NO}_{2}$ and a concentration of $\mathrm{N}_{2} \mathrm{O}_{4}$ equalling $0.0200 \mathrm{~mol} / \mathrm{L}$ was allowed to reach equilibrium: $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \leftrightarrows 2 \mathrm{NO}_{2}(\mathrm{~g})$
The equilibrium concentration of $\mathrm{N}_{2} \mathrm{O}_{4}$ was $0.0045 \mathrm{~mol} / \mathrm{L}$
a) What was the equilibrium concentration of $\mathrm{NO}_{2}$ ?
(Value: 2)

$$
\left[\mathrm{NO}_{2}\right]=0.0310 \mathrm{~mol} / \mathrm{L}
$$

b) What is the numerical value of the equilibrium constant for the equilibrium?
(Value: 2)

$$
\mathrm{K}_{\text {eq }}=\frac{\left[\mathrm{NO}_{2}\right]^{2}}{\left[\mathrm{~N}_{2} \mathrm{O}_{4}\right]}=\frac{(0.0310)^{2}}{(0.0045)}=0.21
$$

23. When win spoils, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ is changed to $\mathrm{CH}_{3} \mathrm{COOH}$ as oxygen from the air reacts with it:

$$
\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+\mathrm{O}_{2}(\mathrm{~g}) \leftrightarrows \mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \quad \mathrm{K}=1.2 \times 10^{82}
$$

Will much $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ remain when the reaction reaches equilibrium? Explain your answer?
(Value: 2)
$K=\frac{[\text { products] }}{[\text { reac tan } t s]}$
Because the value of K is large, the products are highly favoured. Therefore, there will only be a small concentration of reactants at equilibrium. Very little $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ remains at equilibrium.
24. The decomposition of $\mathrm{HI}(g)$ to $\mathrm{H}_{2}(g)$ and $\mathrm{I}_{2}(\mathrm{~g})$ was followed by measuring the concentration of iodine colorimetrically:

| Time $(\mathrm{h})$ | $\left[\mathrm{I}_{2}\right]$ |
| :---: | :---: |
| 0.0 | 0.0 |
| 0.5 | $2.2 \times 10^{-4}$ |
| 2.0 | $3.9 \times 10^{-4}$ |
| 4.0 | $4.9 \times 10^{-4}$ |
| 7.0 | $5.6 \times 10^{-4}$ |
| 10.0 | $5.8 \times 10^{-4}$ |
| 12.0 | $5.8 \times 10^{-4}$ |
| 14.0 | $5.8 \times 10^{-4}$ |

a) Graph $\left[I_{2}\right]$ versus time.
(Value: 1)
lodine Concent rat ion versus Time

b) Show the effect of a catalyst with a broken line on your graph.
(Value: 1)
c) If the equilibrium constant for the reaction, $2 \mathrm{HI}(\mathrm{g}) \leftrightarrows \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g})$, equals $1.83 \times 10^{-2}$, determine the equilibrium concentration of HI.
(Value: 2)

$$
\begin{aligned}
& K_{\text {eq }}=\frac{\left[H_{2}\left[I I_{2}\right]\right.}{[H I]^{2}} \\
& {[H I]=\sqrt{\frac{\left[H_{2} \| I_{2}\right]}{K_{\text {eq }}}}=\sqrt{\frac{\left(5.8 \times 10^{-4}\right)\left(5.8 \times 10^{-4}\right)}{\left(1.83 \times 10^{-2}\right)}}=4.29 \times 10^{-3} \mathrm{~mol} / \mathrm{L}=[\mathrm{HI}]}
\end{aligned}
$$
